Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Charts

1. Canadian cattle and calves for slaughter and live exports	9
--	---

Highlights

- Canadian cattle producers reported 13.2 million head as of January 1 this year, down 5.1% from the previous year.
- Between January 1, 2008 and January 1, 2009, the dairy herd fell 2.5%, while the beef herd fell 5.6%.
- The Country of Origin Labeling legislation (C.O.O.L.) in the United States created an uncertain marketplace for Canadian producers.
- Revenues for cattle and calf producers declined for the first nine months of 2008 from same period 2007.
- Rising input costs, due in part to increased feed grain prices and market uncertainty, had an impact on Canadian producers and has exerted downward pressure on profits.

Analysis

Livestock Statistics, as of January 1st2009

Farm inventories of cattle, hogs and sheep all declined between January 1, 2008 and January 1, 2009, reflecting factors such as market uncertainty and rising input costs.

Text table 1

Livestock inventories at January 1

	Cattle		Hogs		Sheep

Note(s): Figures may not add up to totals because of rounding.

Cattle and calves inventory decreasing

Canadian cattle producers reported 13.2 million head as of January 1 this year, down 5.1%. The national cattle inventory, which has been declining during the past four years, has returned to pre-BSE (bovine spongiform encephalopathy) levels seen in 2003.

Text table 2

Cattle and calves: number by class and calf-crop, Canada

	January 1, 2008	January 1, 2009	2009 as percentage of 2008

Source(s): Statistics Canada, Agriculture Division, Cattle Statistics Catalogue No. 23-012-X.

Beef and Dairy Herds

Between January 1, 2008 and January 1, 2009, the dairy herd fell 2.5%, while the beef herd fell 5.6%. The beef herd shows no sign of rebuilding, as the number of cows is down 6.6% and the number of replacement heifers is down 9.7%.

On January 1 this year, there were 86,520 farm operations reporting beef herds, down 3.8%.

Beef numbers fell last year in the four major beef producing provinces: Alberta (-3.3%), Saskatchewan (-8.0%), Manitoba (-6.1%) and Ontario (-14.5%). These declines continued long-term downward trends. Combined, these provinces accounted for 89.0% of the Canadian beef herd.

For Ontario, the total cattle and calves inventory is the lowest since the data was recorded back in 1940.

Chart 1
Canadian cattle and calves for slaughter and live exports

Cattle receipts and expenses

Revenues for cattle and calf producers declined for the first nine months of 2008 from same period 2007, as a result of falling receipts from animals sent for both domestic slaughter and for feeding. More cattle were exported, but prices fell in all markets. Revenues for cattle and calf producers declined 3.8% for the first nine months of 2008 from same period 2007, as a result of falling receipts from animals sent both for domestic slaughter and for feeding. More cattle were exported, but prices fell in all markets. Rising input costs, due in part to increased feed grain prices and market uncertainty, had an impact on producers and has exerted downward pressure on profits.

In addition, Country of Origin Labeling legislation (C.O.O.L.) in the United States created an uncertain marketplace for Canadian producers. The U.S. Country of Origin Labeling (C.O.O.L.) regulations has led to some production uncertainty within the feeders and fed cattle markets. The deadline to import cattle feeders to be classified as U.S. beef according to the C.O.O.L. regulation was July 2008. Since then, exports for the last six months of 2008 have slowed by 9.7% from the same period a year ago. While exports are slowing, cattle slaughter increased slightly from the previous year but was 13.6% lower than the record set in 2004.

1. For the January to June period, the beginning inventory is dated January 1 and the ending inventory is dated July 1. For the July to December period, the beginning inventory is dated July 1 and the ending inventory is dated January 1. The inventory data for each period cannot be aggregated to make an annual total. The inventory data is a count at a specific point in time.

1. Excluding small numbers of heifers for slaughter and steers on dairy operations.

2. Farms where cattle are fed on a low energy ration such as hay or pasture.

3. Farms where cattle are fed a high energy ration such as grain as they are fattened for market.

Steers	499.5	123.8	242.6	133.1
Total	841.5	288.8	348.4	204.3

1. Excluding small amounts of heifers for slaughter and steers on dairy operations.

2. Farms where cattle are fed on a low energy ration such as hay or pasture.

3. Farms where cattle are fed a high energy ration such as grain as they are fattened for market.

1. Available data adjusted on boneless basis for retail, household, cooking and plate loss.

Concepts and methods

Concepts

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs, sheep and other livestock, referring to inventories at the 1st of the month. The probability samples include about 10,250 operations at January 1, and about 16,250 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are approximately 2,100 and 2,500, respectively, at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle, hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are about 1,000 in June and 1,100 in November. The results are released at the same time as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

The total inventories are now distributed to a specific farm type, on the basis of survey results and sector level balance sheets. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

Canadian exports to the United States are obtained from U.S. import custom documents and are officially released by the International Trade Division of Statistics Canada. These data try to register the province of origin of the commodity, but when unknown, will reflect the province of entry into the United States. Information from secondary sources is used by Agriculture Division of Statistics Canada to better estimate the province in which the commodity was raised/grown. Administrative data from the provinces are used to adjust the export numbers by province to better reflect provincial production. Though this methodology will result in different exports by province, the Canadian export totals will equal those released by International Trade Division.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
